CareerTrack – Project Report

Full-Stack Job Portal and Recruitment Management System | Handover draft

Abstract

• CareerTrack is a full-stack recruitment portal that allows visitors to browse job opportunities and apply online, while administrators manage job postings and review applications through a protected dashboard.

Problem statement

• Recruitment information and applications need a central platform where opportunities can be published, applications collected and reviewed, and candidate progress tracked.

Objectives

• Provide a responsive public job-browsing experience.

• Allow candidates to submit applications and resumes without mandatory registration.

• Provide secure administrator access for job and application management.

• Support status tracking, internal notes, resume review, CSV export and dashboard statistics.

Modules

• Public job listing, search and job details.

• Candidate application and application tracking.

• Admin login and dashboard.

• Job creation, editing, publishing and closing.

• Application listing, job/status/date filters, status updates, notes, resume download and CSV export.

System architecture

• React frontend communicates with an Express REST API.

• Backend uses Mongoose to persist jobs, applications and admin accounts in MongoDB.

• JWT bearer authentication protects administrator operations.

• Multer handles resume uploads.

Testing and verification

• Frontend production build completed successfully during development.

• Backend deployment for application filters was reported Live.

• Live combined job/date/status filter returned one matching application.

• Previously verified workflows include application submission, admin review, status persistence, resume download, tracking and CSV export.

• See Test_Cases.xlsx for additional cases to execute before handover.

Limitations and future improvements

• Use persistent/cloud storage for resumes rather than ephemeral local disk.

• Add file content-signature validation in addition to extension/MIME checks.

• Complete responsive, security and negative-path testing.

• Confirm exact API routes and environment variable names from source before final publication.

• Define data-retention and audit-logging policies.

Conclusion

• CareerTrack implements the core workflow of a job portal and recruitment management system with public applications and administrator recruitment tools.
