CareerTrack – Database Schema

MongoDB / Mongoose | Handover draft

Database

• Database name used by the application: careertrack.

Job model

• Stores job postings and publication state.

• Fields include title, company, location, workMode, employmentType, salary, summary, description, responsibilities, qualifications, skills and status.

• Additional fields include experience, benefits, applicationInstructions, publishedAt and expiresAt.

• Job status values include published, draft and closed.

Application model

• References the related Job document.

• Candidate fields include candidateName, email, phone, education, experience, skills and coverLetter.

• Resume metadata includes stored filename/path and MIME type; file bytes are stored separately under backend uploads in the current implementation.

• Workflow status: Submitted, Under Review, Shortlisted, Interview Scheduled, Selected, Rejected.

• Internal notes are stored for administrator review.

Admin model

• Stores administrator name, email, password hash, role and active state.

• Passwords are hashed using bcrypt; plaintext passwords must never be stored.

Relationships and indexes

• Application.job references Job._id; one job can have multiple applications.

• A unique compound index on job and email prevents duplicate applications by the same email for the same job.

• MongoDB ObjectIds are used for document IDs and references.

Privacy

• Candidate contact information and resumes are private data.

• Resume download must remain behind admin authentication.

• Use dummy data in screenshots and demonstrations.

Verification

• Check Backend/src/models/job.js, application.js and admin.js for exact field types, required flags, defaults and indexes before treating this as a formal schema specification.
